

Migration to a virtualized environment

Benefits

Calsoft helped the customer:

- Improve hardware utilization, offering better ROI
- Reduce Capex, Opex by 50%
- Achieve their overall objective at a lower cost and with guaranteed support from a proven technology vendor
- Find a solution that was easier to maintain and with high fault-tolerance

The Challenge

The client had several internal IT users and was providing critical services to each including Active Directory, Domain controller and software update service, Subversion, CVS, Bugzilla and DNS/DHCP. Each of these services were running on different Operating Systems and environments. The client was looking to move to an environment and thereby increase their hardware utilization while reducing power consumption and maintenance activities.

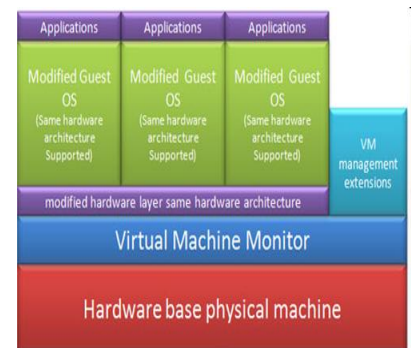

The Solution

Calsoft Labs set about migrating the client's systems to a virtualized environment.

The servers were consolidated into two physical boxes. VMware ESXi servers installed on servers. All the client's applications were migrated using VMware P2V.

Environment

- VMware ESXi server
- VMware Infrastructure client
- Veeam FastSCP for VMware ESXi
