

Virtual Infrastructure Management from Application Switch

Benefits

Calsoft helped the customer:

- Achieve their overall objective at a lower cost and with guaranteed support from a proven technology vendor

The Challenge

The challenge was to develop an application to do adaptive load balancing from an application switch – provisioning and graceful shutdown of resources as needed.

The Solution

Calsoft Labs developed a Java based customized Virtual Infrastructure client for the customer. The solution uses Apache Axis library WSDL stubs to communicate with Vmware VirtualCenter. The solution also uses SDK APIs to perform management operations. It listens for real time VM event notifications for status update.

Environment

- Vmware VI SDK
- Apache Axis WSDL library
